

```
1.
<?php
require '../vendor/autoload.php';
//connect to mongo
$con=new MongoClient("mongodb://localhost:27017");
echo $con;
//select a database
$db = $con->admin;
echo "<br>Database admin selected<br>";
$collection =$db->sample;
//echo $collection;
$data=array(
'name'=>'NithinR',
'age'=>23,
'email'=>'nithinr@gmail.com',
);
$collection->insertMany($data);
echo "Inserted successfully!";
?>
```

The screenshot shows a web browser window with the address bar displaying `localhost/Project/connection.php`. The page content shows the output of the PHP script: `mongodb://localhost:27017`, `Database admin selected`, and `Inserted successfully!`.

Below the browser window, the MongoDB Compass interface is shown. The left sidebar displays the database structure with `admin` and `sample` databases. The `sample` database is selected, and the `Documents` tab is active. The main area shows a single document with the following fields:

```
{
  "_id": ObjectId('649917e7f830eb2670085ce4'),
  "name": "NithinR",
  "age": 23,
  "email": "nithinr@gmail.com"
}
```
